Introductory video to Renewable Energy for Local Development

Biomass nergy online course (Module 1, part 3)

Videoscript

Welcome to the Biomass module of Renewable energy for local development course. My name is Csaba Patkós, I will be your tutor in this course.

Biomass modul is a part of the Renewable energy for local development course so it has a similar structure as the former courses

Estimated duration of the module is 3 weeks and you should spent at least 10 hours/ week with the online course.

Biomass module includes a theoretical part and a practical part. The theoretical part covers technical alternatives and specification, economic approach, social and environmental impact and rural development aspects.

In the practical part, I will present a fully developed study case of an application of the module covering the technical, economic, social, environmental and rural development parts.

First of all always read the text carefuly because your answers will be marked.

It is also important to follow the original order of the test because the subchapters follow each other consequtively.

As usual, forum is a platform to communicate. The forum topics will be created by the tutor, and you will be asked to participate in the discussions. However, students will also be able to create sub-topics about any difficult part of the course material.

The forum will provide the opportunity for all the participants to communicate effectively, and read others' earlier comments made when they were not online.

The online tutorial session will indicate the hours when the students can communicate with the English tutor real-time. There will be one hour per week provided for students to ask questions and clarify unclear parts of the material.
